

RT- Impact

Panaya Impact Analysis Interface Add-on

RT-Impact incorporates impact analysis into your Rev-Trac managed SAP change control processes with Panaya

Available as one of the Rev-Trac Add-on Suite of products, RT-Impact enables impact analysis as an automated and enforced part of a standard Rev-Trac SAP change management process.

SAP environments are becoming more complex and require increased transparency and automation for better control and efficient delivery of well tested changes into production. This means SAP users are now, more than ever, in search of technology that will manage any defined end-to-end process.

Revelation Software Concepts and Panaya Inc. have anticipated SAP change team's need to incorporate impact analysis into their standard day-to-day change management processes to provide a single solution that manages and enforces SAP system changes whilst enforcing impact analysis on both, code and configuration changes.

All-In-One Process Integration

Rev-Trac SAP change control technology combined with automated Panaya Impact Analysis provides a single solution that enforces any combination of change request, approval and migration process, with the ability to enforce an impact analysis on any customized SAP system change, in a simple progression.

Rev-Trac allows SAP users to track the relationship of transports to their associated business issues and now, the option to enforce impact analysis as part of the defined change process, will produce a full understanding of the effects of changes made to resolve business issues.

Before change requests are released into production, the user can review and approve the impact analysis, using its clarification of all affected modules and transactions to identify and eliminate risk of harmful business disruptions.

Rev-Trac's powerful and highly configurable change control technology and Panaya's SaaS-based cross-application impact analysis solution integrate to provide:

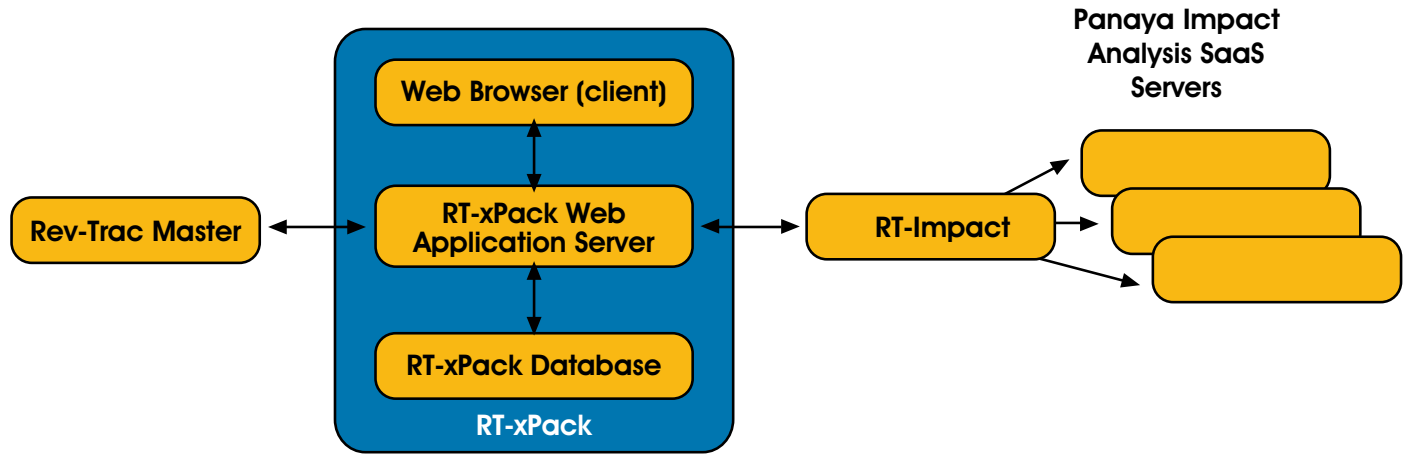

- A single ready-made solution that provides change control process automation and the enforcement of impact analysis for code and configuration changes, before they are put into production
- Increased visibility for SAP professionals, IT departments, system integrators and business consultants of potential system configuration impact across the various SAP modules
- A connection between configuration change transports, potential system impacts and the business issues the changes resolve
- Minimized customization errors, reduced system downtime, efficient test scoping and safe system migrations
- Reduced risk and costs associated with implementing, maintaining, and upgrading SAP systems

Prerequisite

RT-Impact is one of the Rev-Trac add-ons in the Rev-Trac Add-on Suite. It is available on its own or as part of the suite and requires deployment of the Rev-Trac Extension Package (RT-xPack) as a prerequisite.

Architecture

The RT-xPack employs a multi tier client-server architecture.

	RT-xPack (Prerequisite)	RT-Connect	RT-xDeploy	RT-OOPS+	RT-Analyze	RT-Impact
